Access to clean water

Within my community there is something that really annoys me and that is there is no access to clean water. When we moved in our neighbors told us that the place was good except the water was a little dirty. So much so that they need to buy one of those office water dispensers. I think that our community should have access to clean water whenever they feel like. Because if this doesn't get fixed people can get sick from the bacteria on the water. Or even worse they could die if the water contains deadly bacteria.

Because there is no access to clean water in my community bacteria can find their way easily into an individual body getting them sick. If this individual is a grandma or grandpa the disease can become more deadly. I think that if community gets better drinking water it would bring those risks down. Not only that but better drinking water means that both old and young people will have better health. But in my community, it doesn't seem like other people are going to do anything about it.

So, I have a plan to get better drinking water in a matter of seconds. My plan is to tell my neighbors if they could help spread the word to get people aware of the danger, they are in. After that people might decide to buy filters and that's step one. After they buy filters, I will ask my neighbors or my parents to spread the word again. This might not work at first because people might think they already found a solution to their problem.

But after people realize that they are having to pay taxes and still not get clean drinking water. Plus having to pay to get new filters every month. The people are going to protest for the clean water they deserve and are paying for. After that they will be forced to install clean drinking water. Plus paying the people that need to deal with this clean drinking water problem a fair amount of money.

After this problem is fixed there would be less people getting sick. Less people dying from deadly diseases. Healthier people with longer life spans. Which all concludes to a happier community. So that's how I would fix the water drinking problem in my community with a little help from my parents and neighbors.
